Review II of Mini Project I / II / Project Work

Project title: Development of Captcha App: Seamless Attendance Monitoring with AI Recognition.

Abstract

This proposal introduces a smart attendance and on-duty management system that integrates secure login, face recognition, and automated workflows for academic and transportation purposes. Faculty and students access the portal using credentials, after which attendance is captured through a camera-based recognition system employing MTCNN for face detection and VGGFace for verification. Attendance is strictly time-bound, with each course allowing a 5-minute marking window.

For students seeking On-Duty (OD) approval, a digital form captures essential details including name, roll number, reason, date, time, and passport-size photograph. The form follows a hierarchical approval flow from Tutor → Academic Coordinator → Head of Department (HOD), with the HOD's decision required at least 10 minutes prior to the scheduled time. Upon approval, the OD is automatically updated in the attendance portal.

Students also access a mobile application to view attendance, submit OD requests, and manage additional permissions. Hostel students may generate outpasses, while bus students can monitor bus attendance, which is automatically recorded via bus-mounted cameras using the same recognition system.

This system ensures accuracy, transparency, and efficiency in academic and transport attendance, reduces manual intervention, and provides a unified platform for students, staff, and administrators.
